Manufacturing

Use of Beam Deflection to Control Electron-Beam Wire Deposition

Advanced process control technique for electronbeam
free-form fabrication and welding

NASA's Langley Research Center researchers have a strong technology foundation in the use of electron-beam (e-beam) deposition for free-form fabrication of complex shaped metal parts. While e-beam wire deposition is of interest for rapid prototyping of metal parts, cost-effective near-net shape manufacturing, and potential use in space, it is also of intense interest for industrial welding and fabrication in a range of applications, from small components to large aerospace structures. Through significant advancements in techniques to improve control of the process, NASA greatly expands upon the capabilities of the e-beam fabrication and welding process.

BENEFITS

- Self-correcting stabilizes and optimizes e-beam heating of the wire during the deposition process
- Provides continuous and predictable deposition pattern
- Simplifies deposition of complex geometries
- Optimizes microstructural control of the solidified molten metal
- Provides efficient use of power and feedstock
- Improves automated operation

technology solution

NASA Technology Transfer Program

Bringing NASA Technology Down to Earth

THE TECHNOLOGY

The technology employs rastering of the e-beam in the region of the wire and substrate melt zone. By controlling the raster pattern, the e-beam selectively heats the outer edges of the wire as it strays from the melt zone. With such selective heating, the wire automatically curls back away from the high heat outer edge and back into the region of the molten pool. Thus, with a fixed raster pattern, the process becomes self-correcting without any sensing or external control of process parameters.

The technology offers wide-ranging market applications, including medical devices.

APPLICATIONS

The technology has several potential applications:

- Welding of metal structures for automotive, aerospace, and other industrial and commercial manufacturing
- Free-form fabrication of complex metal components in remote locations
- Near-net shape manufacturing and rapid prototyping
- Applicable to variety of metal fabrication markets, from automotive and aerospace to sporting goods and medical devices

NASA's Technology Transfer Program pursues the widest possible applications of agency technology to benefit US citizens. Through partnerships and licensing agreements with industry, the program ensures that NASA's investments in pioneering research find secondary uses that benefit the economy, create jobs, and improve quality of life.
